There are many businesses that operate only during the day and only require back up power during work hours. With the automatic transfer switch it will operate round the clock and if the power fails during the night it could have the generator running for no purpose and wasting fuel. The manual transfer switch allows the user total control over power flow. It is simple and easy to install and operate and requires almost no maintenance. It can operate in a wide range of temperatures from 5 degrees Celsius up to 40 degrees Celsius. It needs to be protected from rain and should not be used in an area where there are volatile gases. The unit is perfect for a residential dwelling or a small business where the owner or staff can turn on a generator if there is a power failure and operate the switch. The primary advantage of a manual switch is the reasonable price. It is lower in cost to design and manufacture than an automatic transfer switch. A window can be fitted to the power cabinet that the unit is installed in to enable the user to see where the switch is pointing. This could be dangerous as workers expect it to be dead and injury could occur if there was current running through them. If you have infrequent power failures then this product is perfect for you. An automatic transfer switch (ATS) is a “smart” switch that is used to sense when utility power has been lost. When the ATS detects a power outage, within seconds, will automatically transfer the power source from the lost utility power, to start and use the home generator for power. Once the main utility power is restored, the ATS will again detect the main power source is back on, then automatically switch back to utility power and turn off the generator. Simply start the generator, plug it in, and flip a switch to lock out the utility and transfer the load to the generator. We have an excellent rating with the BBB. It is always a privilege to serve you with your power generation needs. It is able to actuate the automatic transfer between the normal power and reserve power, requiring no manual operation.
